

Dear Editors,

Please consider this Research Article, “Source-only model selection and limits of fixed spectral-sharing pipelines in cross-subject motor-imagery EEG decoding”, for publication in PLOS ONE.

The study examines how source-only training-duration selection and participant heterogeneity constrain claims about calibration-free motor-imagery EEG decoding. It combines a model-selection audit with frozen external evaluation and retains adverse and uncertain findings. The contribution is a reproducible selection and evaluation evidence chain, rather than a new state-of-the-art domain-generalization algorithm. A separate sensor-level physiological analysis is descriptive and does not establish a decoder mechanism.

The manuscript provides documented methods, participant-level outcomes, uncertainty estimates and explicit limitations. Code, manuscript candidates and frozen research outputs are publicly accessible on GitHub. The author reports no prior journal or preprint-platform publication.

Original EEG is obtained from the original providers; saved predictions, derived summaries and validation evidence are supplied or linked. AI assistance and author verification are disclosed in the Methods. Funding and competing-interest statements are provided in the submission fields.

I am the sole and corresponding author and take responsibility for the scientific content. Please address correspondence to the contact details below.

Sincerely,
Ziyuan Zhu
